

- **Region Admin Layers:** This is where the administrative grids can be found for country, state, and county boundaries. For preloaded data, regional administrative layers have been defined. For example, in the *United States* setup, the *Nation*, *State*, and *County* layer will be automatically selected. As discussed in Chapter 4, you can preselect default administrative layers for new setups you create when you import air quality grids. You can turn administrative layers on or off by expanding the group.
- **Pollutants:** This is where all the available pollutant data (from the tree menu) will be visible. Under this main group, there will be a group for each pollutant that was selected (e.g., *PM<sub>2.5</sub>*). Below the individual pollutant, there will be metrics that were defined earlier during import and loading (e.g., *Quarterly Mean*, *D24HourMean*). Below each metric, there will be entries for each Air Quality Grid that was loaded (e.g., *Baseline*, *Control*, and *Delta*).
- **Results:** This is where the layers for Health Impact Results, Pooled Incidence Results, and Pooled Validation Results will be listed. Under the results group, there will be a subgroup labeled for each set of results. Usually, these entries will be labeled by the study author's name.

## Color Ramps

The color ramps are standard for the imported files. The default color ramp for the **Baseline** and **Control** Air Quality Grids goes from light green to dark blue. The default color ramp for the **Delta** Air Quality Grid goes from light yellow to dark red. Finally, the default color ramp for the **Results** group entries will be different from each other and any other color ramps that are already in the table of contents.

These color ramps can be changed by the user, if desired. There are two possible ways to change the colors:<sup>25</sup>

- 1) To change the whole color scheme: Right click on a layer and select the **Properties** option. This will open a **Layer Properties** window, where you can change the color ramps and other properties.

- 2) To change one index within a color ramp: Click on the color box or number range that you wish to change. This opens the **Polygon Symbolizer Properties** window.

<sup>25</sup> BenMAP-CE uses DotSpatial to incorporate, analyze, and map spatial data. The editing tools for layer properties are those included in the DotSpatial libraries and have not been customized for BenMAP-CE. For more information, see: <http://dotspatial.codeplex.com/>.

## Add/Remove a Group

To add a group to the GIS table of contents, right-click on a group, and click **Create New Group** from the pop-up menu. This will add the new group below the group that was right-clicked on.

To remove a group from the GIS table of contents, right-click on the group you wish to remove, and then click **Remove Group** from the pop-up menu. This will remove the entire group from the table of contents.

## Remove a Layer

To remove a spatial layer from the GIS table of contents, right-click on the layer you wish to remove, and then choose **Remove Layer** from the pop-up menu. This will remove the layer from the table of contents.

Note: Adding a layer will be discussed in the GIS Toolbar section (Section 8.3.1.2).

### 8.3.1.2 GIS Toolbar

There are a number of standard buttons used in most map viewing programs which you can use to navigate and customize the map view. To see the name of each button in the toolbar (to the left of the GIS table of contents), simply hold the cursor over it.

**Increase zoom.** Allows you to zoom in.

**Decrease zoom.** Allows you to zoom out.

**Drag mode.** Allows you to manually move the map by clicking and dragging.

**Zoom to full extent.** Allows you to view the whole map that you are viewing.

**Click to display info for the cell in popup window.** Allows you to display information (all the variable values) for individual cells or points by clicking on them.

**Attribute Table.** Opens an Attribute Table Editor Window where the user can view, edit, or filter the data for a specific layer.

**Select Features.** Allows you to select features from the map. Press and hold Ctrl to select multiple features at one time.

**Select By Location.** Allows you to select features from a layer based on its spatial relationship with another layer.

**Clear Selection.** Clear selections from all layers.

**Add Layer.** Allows you to add a new layer to the table of contents and map. Typically the new layer is added near the top of the table of contents.

**Export Map Image.** Prepare print layout of GIS map and legend.

**Save Shapefile.** Save and export results from a GIS layer on current map.

**Change Projection to \*projection type\*.** Allows you to change/toggle the type of map projections between the following types: GCS/NAD 83 (standard), Albers.
