

The table at the bottom of the window will update to display the attributes for the saved scenario (*Scenario Name, Color, Total Countries, Total Population, Type of Rollback, etc.*), along with an *Execute?* option for you to indicate whether the tool should execute or ignore the scenario. If you double-click in the Total Countries or Total Population fields, the program will display a table of the individual countries and populations included in the scenario.

9.7.5 Execute Scenarios and Save Results

Click the **Execute Scenarios** button to generate results for saved scenarios. If a selected country does not have sufficient data (i.e., population, pollution concentration, or incidence rates) to perform the analysis, it will be bypassed and a message (including the country name) will be provided.

If you are adding to a list of saved scenarios and do not want to re-run the previously executed ones, uncheck *Execute?* in the summary table so that only the new scenario is checked.

Upon execution, the **GBD Rollback** tool will export results in (.xlsx format) to a default file location.³⁷ You can change the file location by clicking the **Browse** button. You can

³⁷ The files are stored by default at the following location: C:\Users\<User Name>\Documents\My BenMAP-CE Files\GBD.

also change the export file format to *CSV* by clicking on the **Format** drop-down list. The results file is named using the *Scenario Name* followed by the time stamp of scenario execution.

- The *XLSX* option provides a formatted summary table, detailed results, charts, and metadata about the supporting datasets used in this analysis.
- The *CSV* option will only create two files: one containing the summary data and one with detailed results.

If you want to edit or delete saved scenarios, select one record at a time from the scenario table (use the record selector on the left side of the grid) and click the **Edit Scenario** or **Delete Scenario** button. If a scenario is edited and re-executed, the timestamp in the filename will help the user identify the new version.

Once you close the **GBD Rollback** tool, the scenarios are cleared from memory; scenarios are not saved in the BenMAP-CE database. Information about the scenario configurations are saved in the results file to help you document the analysis and re-create it if necessary.

The GBD results file (.xlsx format) contains six worksheet tabs, described as follows:

- **Summary:** Gives a basic background on the scenario chosen, including name, description, pollutants, rollback type, health impact function, VSL selection, and countries. It also provides a quick overview of total and affected population results.
- **Detailed Results:** Gives in-depth breakdown of population and results for each selected country. Important fields on this tab include *Population Affected*, *Avoided Deaths (Total)*, *Economic Benefits*, *Avoided Life Years Lost*, and *Change in Life Expectancy*.
- **Avoided Deaths by Country:** Displays the number of avoided deaths for the region and by country in a bar graph. This graph was generated from the data on the **Detailed Results** tab.

- **Deaths Per 100,000:** Displays the number of deaths for each country (with a population multiplier of 100,000) in a bar graph. This graph was generated from the data on the **Detailed Results** tab.
- **Economic Benefits:** Displays the economic benefits associated with avoided premature mortality for the region and each country in a bar graph. This graph was generated from the data on the **Detailed Results** tab.
- **Metadata:** Provides supplementary information about the underlying data and functions used by the **GBD Rollback** tool.

9.8 Monitor Data Conversion

The **Monitor Data Conversion Tool** provides the user with a mechanism to transform their data from commonly available formats (e.g., one monitoring result per row) to BenMAP-ready format. The tool is currently under development for inclusion in a future version of BenMAP-CE.

9.9 Neighbor File Creator

The **Neighbor File Creator** tool generates a file containing gridded monitor data created by BenMAP-CE for *Monitor Data* or *Monitor Rollback* air quality surfaces.

To start, choose *Neighbor File Creator* from the **Tools** drop-down menu. This will bring up the **Create Neighbors File** window. Click on the **Browse** button, and find the air quality surface you want to analyze.

After locating the file, click the **OK** button. The file path for the selected file will be displayed in the **Air Quality Surface** box. Click **OK**. A **Save As** window will open. Provide a file name for the **Neighbors file (.csv)** you want to create and click **Save**. An example Neighbors File is shown below.
