

are created during when importing a grid definition or calculating health impacts and economic benefits. BenMap-CE does not remove or overwrite a crosswalk automatically if it already exists. In cases where a crosswalk was broken due to database error or force quitting of the application, users can use this tool to remove the crosswalk from the database. Users may then let BenMap-CE automatically re-generate the crosswalk during processing or re-create it in the tool to save time later.

To re-create crosswalks, go to the **Tools** menu, and choose the **Compute Grid Crosswalks**.

This will bring up the Crosswalk Calculator window. You will see all grid definitions associated to the active setup are listed in both windows. To switch to a different setup, choose another setup from **Available Setups**.

To remove all crosswalks among the grid definitions in the windows, click **Clear Existing Crosswalks**. A message box will pop up asking you to confirm this operation. Click **OK** to confirm. In the screenshot below, we are trying to remove all existing crosswalks for *Detroit* setup from the database. NOTE: crosswalks for default setups (e.g. *China* and *United States*) are locked and cannot be removed.

To create or overwrite a crosswalk between two grid definitions, highlight one grid definition from the left side, highlight the other grid definition from the right side, and click Compute Crosswalk button. If the crosswalk already exists, you will be asked to confirm replacement by clicking **OK** in the message box. In the screenshot below, we selected *Detroit ZIP Codes* from the left window and *Detroit Counties* from the right window to create crosswalks between the grids for both directions.

The calculation may process slowly depending on the size and resolution of your grid cells. If you have to interrupt the process, simply click Cancel Operation. It is recommended to highlight the grid definition with higher resolution from the left window and the one with lower resolution from the right window. This will speed up the calculation.
